engine originally made by Chevrolet. Over 1.7 million engines were delivered. Aircraft conversions produce 100-120HP. The engine has been flying since 1960 and has evolved to a very smooth, reliable and robust power plant. All parts needed for a conversion are still manufactured and readily available.

The Corvair air-cooled engine was

constructed mostly of aluminum — a cutting-edge technology for passenger car engines at the time. In October 1957, GM broke ground on the engine foundry at Massena, New York to specifically build the Corvair engine castings.

History of Corvair Flight Engines - corvair750

The Corvair engine with its light weight was capable of producing a very high Torque of 190 foot pound at a relatively low 3000 RPM range. GM boosted it to 180hp with the Turbo version. The Corvair engine, structurally speaking, could be running all day long without over stressing itself,

I got a ride in the 650 in June, felt like a really nice engine - but I could easily build a second Corvair as a "backup" and still come in well under that for 2 complete engines. I think another reason the KR's may have problems is they have to swing a smaller diameter prop and thus the RPM's go up, so they cruise a lot closer to 4000 rpm.
