Obstacle Avoidance Control for the REMUS Autonomous ...
Obstacle Avoidance. A vehicle with obstacle avoidance (or passing assistance) has a sensor, such as lidar, that measures the distance to an obstacle in front of the vehicle and in the same lane. The obstacle can be static, such as a large pot hole, or moving, such as a slow-moving vehicle.

Obstacle Avoidance Using Adaptive Model Predictive Control ...
The IR Obstacle Avoidance Module can be used in place of a dedicated Momentary Button Switch. That is, this IR Module should probably be chosen and used more often than it is. The IR Obstacle Avoidance Module typically comes configured with three pins, as can be seen in an attached photograph. The pins are labeled OUT, GND, and VCC.

Obstacle Avoidance Optimal Control in MATLAB
In Weihua and Go (2011), model predictive control (M MPC) method for UAVs formation coordination and obstacle avoidance for any shape and size of obstacles is introduced. In this paper, the artificial potential field method is combined with rotational vectors and applied to formation control of UAVs. An UAV in formation is defined as the leader.

UAV formation control design with obstacle avoidance in ...
A nonlinear controller is designed to achieve tracking target and obstacle avoidance in complex environments. Note that tracking errors converge to a residual set outside the obstacle detection region. Moreover, the obstacle avoidance is also guaranteed inside the obstacle detection region.

Nonlinear Control for Tracking and Obstacle Avoidance of a ...
Abstract: We propose a novel shared control strategy for mobile robots in a human-robot interaction manner based on surface eletromyography (sEMG) signals. For security reasons, an obstacle avoidance scheme is introduced to the shared control system as collision avoidance guidance. The motion of the mobile robot is a resultant of compliant motion control and obstacle avoidance.

Obstacle Avoiding Car - Arduino Project Hub
The obstacle avoidance unit is attached to the bottom of the drone. It activates once it's 2-3 feet away from objects. The drone stops approaching the object and halts automatically. This feature only works when it is 3 feet above ground.

9 Best Obstacle Avoidance Drones: Anti-Collision Detection ...
The advantage is that the obstacle avoidance control input can be integrally analyzed combined with the optimal control input via Theorem 2. Remark 8. The former item in control law, , can optimize all subsystems from global control. The latter item in control law, , is specifically for UAV. Since the non-quadratic potential function does not design an appropriate function for a high-order model, this obstacle avoidance methodology may not be applied to the air obstacle class.

Distributed optimal consensus with obstacle avoidance ...
Obstacle Avoidance Obstacle Avoidance enables a vehicle to navigate around obstacles when following a preplanned path. The feature requires a companion computer that is running computer vision software. This software provides a route for a given desired trajectory, mapping and navigating around obstacles to achieve the best path.

Obstacle Avoidance - PX4 v1.9.0 User Guide
The mathematical model uses velocity control for obstacle avoidance without steering control. The obstacle avoidance is attained through velocity control and strategies are formulated with ...

The VITUS' obstacle avoidance system is based on 3 precision time-of-flight sensors and an infrared sensor on the bottom which is used for positioning and hovering. The ToF sensors offer an extremely high degree of precision, but can only detect meters up to 5 meters away in three directions.
